St. Mary's College 2008 Drinking Water Quality Report

Important Information about your Drinking Water:

Special points of interest:

- The water at St. Mary's College was tested for over 120 different compounds
- The St. Mary's College drinking water consistently met both State and Federal requirements
- Drinking Water, including bottled water, may reasonably be expected to contain at least small amounts of some compounds. The presence of these compounds does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency (EPA) Safe Drinking Water Act Hotline (800-426-4791)

Ye're pleased to present to you the Annual Water Quality Report for 2008. This report is designed to inform you about the water quality and services we deliver to you every day. Our goal is to provide you with a safe and dependable supply of drinking water. More than 800 tests for over 120 compounds were conducted on the water at St. Mary's College. Maryland Environmental Service, an Agency of the State of Maryland, operates the St. Mary's College water treatment facility, and prepared this report. We want you to understand the efforts made to continually improve the water treatment process and protect our water resources. We are committed to ensur-

ing the quality of your water.

We're pleased to report that your drinking water consistently met both Federal and State requirements. This report shows the water quality and explains what it means.

If you have any questions about this report or have questions concerning your water utility, please contact Mr. Jay Janney of Maryland Environmental Service at 410-729-8350 or jiann@menv.com

We want everyone to be informed about their water.

he water for St. Mary's College comes from two wells. One well is no longer in service due to the construction of the new athletic field. The underground source of the well water is called the Aquia aquifer. After the water is pumped out of the well, we add disinfectant to protect against microbial contaminants. The Maryland Department of the Environment has performed an assessment of the source water.

Ome people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

RECEIVED

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

n order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain compounds in water provided by public water systems. We treat our water according to EPA's regulations. Food and Drug Administration regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Water Quality Data

The table below lists all the regulated drinking water contaminants that we detected during the past several years. The presence of these compounds in the water does not necessarily indicate that the water poses a health risk.

Unless otherwise noted, the data presented in the table is from testing done January 1 – December 31, 2008. The State requires us to monitor for certain contaminants less than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year.

RADON:

We constantly monitor the water supply for various constituents. We have detected radon in the water supply on a sample collected in November 2002. At this time, there is no Federal Regulation for radon levels in drinking water. Compared to radon entering the home through soil, radon entering the home through tap water will in most cases be a small source of radon in indoor air. Exposure to air transmitted radon over a long period of time may cause adverse health effects. The radon result of the sample was 185 (pCi/l = picocuries per liter, a measure of radioactivity). For additional information call the EPA radon hotline at 1-800-SOS-RADON
